Introduktion

Peritonsillar abscess (PTA) refers to a collection of pus between the tonsillar capsule and the lateral constrictor muscle. Currently, there are no validated questionnaires available for use in analyzes of PTA.

Study 1: To establish a patient-reported outcome measurement (PTA Assessment Tool-xx) for the assessment of the severity of symptoms and the effects of different treatment modalities in patients with PTA.

Study 2: To investigate PTA patients Quality Of Life (QOL) 3 and 12 month after surgical treatment and compare the results between patients treated with aspiration/incision versus acute tonsillectomy.

Materiale/metode

In this prospective questionnaire study, we plan to include 50 PTA patients at Aarhus University Hospital and Aalborg University Hospital. Fifty medical students are used as controls. A survey using a 5-point likert scale is generated through three phases: 1(item generation), 2(item reduction and reliability analysis), and 3(validation). The patients receive the survey by email at day 1-8 +14, and controls at day 1+8. A 3+12 month follow-up questionnaire are performed.

Resultater

.

Diskussion

The common use of the generated PTA assessment tool makes way for reliable studies on the treatment of patients with PTA and for inter-study comparisons.
