Uddannelsesniveau

Hoveduddannelse, tidlig fase. Projektet er fra igangværende forskningstræningskursus. Resultaterne forventes at være klar før årsmødet.

Introduktion

Simple external otitis is normally treated in the primary sector with aural toilet and topical treatment. Some require hospitalization due to prolonged disease. The aim of the present study was to identify patients' characteristics hospitalized due to the external otitis continuum and separate them into specific disease entities.

Materiale/metode

In this observational retrospective cohort study patients' characteristics and demographic data from hospitalized patients with external otitis during a period of six years, were registered and analyzed.

Resultater

79 medical records were reviewed. A part of these fulfilled the criteria for the diagnosis malignant external otitis and another part did not, but still required treatment during hospitalization due to prolonged disease and treatment failure in the primary sector.

Diskussion

We expect to present a differentiation of the external otitis continuum from simple to complicated to malignant external otitis and to present the characteristics for each group.
