Introduktion

Endoscopic sinus surgery is a common procedure among otorhinolaryngologists. The procedure is performed for chronic inflammation and benign or malignant lesions. To the best of our knowledge, no study has identified essential elements of endoscopic sinus surgery based on a broad approach.

In this study, we aimed to identify essential elements in endoscopic sinus surgery based on an international consensus among content experts. The study is ongoing, but we will be able to present the outcome at DSOHH meeting.

Materiale/metode

In close collaboration with the European Rhinologic Society content experts were invited to participate in the study. An international panel was established. Through three rounds items were identified, and important items were voted through and included in the final assessment tool. Content experts will at the end of the study be asked whether the tool contains essential technical elements and if they deem it useful in future training and assessment of junior doctors.

Resultater

37 content experts were enrolled through an invitation forwarded by the European Rhinologic Society. Through a 3-round Delphi process around 25 items were identified. We are now in the process of the 3rd round where the final consensus is established.

Diskussion

The use of international content experts in a Delphi panel contributes to the tool being of national- as international relevance in future training and assessment of junior doctors. In a forthcoming study, we will validate the assessment tool.
